FORM PTO-1390 (REV 10-94) U.S. DEPARTMENT OF COMMERCE PATENT AND TRADEMARK OFFICE				DOCKET #: 4925-204PUS
TRANSMITTAL LETTER TO THE UNITED STATES DESIGNATED/ELECTED OFFICE (DO/EO/US) CONCERNING A FILING UNDER 35 U.S.C. 371				10/030798
				U.S. APPLICATION NO. (If known, see 37 CFR 1.5)
INTERNATIONAL APPLICATION NO **PCT/EP00/06645**		INTERNATIONAL FILING DATE **12 July 2000**		PRIORITY DATE CLAIMED **14 July 1999**

TITLE OF INVENTION

A Method Of Selecting A New Cell

APPLICANT(S) FOR DO/EO/US

Oscar SALONAHO; Kaisu IISAKKILA; Sari K. KORPELA; Kaj JANSEN

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:

1. [x] This is a **FIRST** submission of items concerning a filing under 35 U.S.C. 371.
2. [] This is a **SECOND** or **SUBSEQUENT** submission of items concerning a filing under 35 U.S.C. 371
3. [x] This express request to begin national examination procedures (35 U.S.C. 371(f)) at any time rather than delay examination until the expiration of the applicable time limit set in 35 U.S.C. 371(b) and PCT Articles 22 and 39(1).
4. [x] A proper Demand for International Preliminary Examination was made by the 19th month from the earliest claimed priority date.
5. [x] A copy of the International Application as filed (35 U.S.C. 371(c)(2))
   a. [x] is transmitted herewith (required only if not transmitted by the International Bureau).
   b. [x] has been transmitted by the International Bureau.
   c. [] is not required, as the application was filed in the United States Receiving Office (RO/US)
6. [] A translation of the International Application into English (35 U.S.C. 371(c)(2)).
7. [x] Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371(c)(3))
   a. [] are transmitted herewith (required only if not transmitted by the International Bureau).
   b. [] have been transmitted by the International Bureau.
   c. [] have not been made; however, the time limit for making such amendments has NOT expired.
   d. [] have not been made and will not be made.
8. [] A translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)).
9. [x] An oath or declaration of the inventor(s) (35 U.S.C. 371(c)(4)). **Unexecuted**
10. [] A translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371(c)(5)).

Items 11. to 16. Below concern other document(s) or information included:

11. [x] An Information Disclosure Statement under 37 CFR 1.97 and 1.98.
12. [] An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.
13. [x] A **FIRST** preliminary amendment.
    [] A **SECOND** or **SUBSEQUENT** preliminary amendment.
14. [] A substitute specification.
15. [] A change of power of attorney and/or address letter.
16. [x] Other items or information *(specify)*: PCT Publication Sheet, Int'l Preliminary Examination Report, Int'l Search Report, PCT Request, PCT Demand, Notice Informing the Applicant of the Communication of the International Application to the Designated Offices, (Two) Notifications of the Recording of a Change.

U.S. APPLICATION NO. (If known, see 37 C.F.R. 1.5) 10/030798	INTERNATIONAL APPLICATION NO. PCT/EP00/06645	ATTORNEY'S DOCKET NUMBER 4925-204PUS

531 Rec'd PCT/PT 11 JAN 2002

17.[x]The following fees are submitted:		
Basic National Fee (37 CFR 1.492(a)(1)-(5)): Search Report has been prepared by the EPO or JPO ..... **$890.00** International preliminary examination fee paid to USPTO (37 CFR 1.482)..... **$710.00** No international preliminary examination fee paid to USPTO (37 CFR 1.482) but international search fee paid to USPTO (37 CFR 1.445(a)(2))..... **$740.00** Neither international preliminary examination fee (37 CFR 1.482) nor international search fee (37 CFR 1.445(a)(2)) paid to USPTO ..... **$1040.00** International preliminary examination fee paid to USPTO (37 CFR 1.482) and all claims satisfied provisions of PCT Article 33(2)-(4) **$100.00**		
ENTER APPROPRIATE BASIC FEE AMOUNT =	$	890
Surcharge of **$130.00** for furnishing the oath or declaration later than [] 20 [] 30 months from the earliest claimed priority date (37 CFR 1.492(e)).	$	

Claims	Number Filed	Number Extra	Rate		
Total Claims	162 - 20 =	142	x **$18.00**	$	2556
Independent Claims	5 - 3 =	2	x **$84.00**	$	168
Multiple dependent claim(s) (if applicable)			+ **$280.00**	$	
TOTAL OF ABOVE CALCULATIONS =				$	3614
Reduction of ½ for filing by small entity, if applicable.				$	
SUBTOTAL =				$	3614
Processing fee of **$130.00** for furnishing the English translation later than [] 20 [] 30 months from the earliest claimed priority date (37 CFR 1.492(f)). +				$	
TOTAL NATIONAL FEE =				$	3614
Fee for recording the enclosed assignment (37 CFR 1.21(h)). The assignment must be accompanied by the appropriate cover sheet (37 CFR 3.28, 3.31). **$40.00** per property +				$	
TOTAL FEES ENCLOSED					$3614
			Amount to be refunded:		$
			charged:		$

a. [x] One check in the amount of $ 3614 to cover the above fee is enclosed.
b. [] Please charge my Deposit Account No. 03-2412 in the amount of $_____ to cover the above fees. A duplicate copy of this sheet is enclosed.
c. [x] The Commissioner is hereby authorized to charge any additional fees which may be required, or credit any overpayment to Deposit Account No. 03-2412. A duplicate copy of this sheet is enclosed.

NOTE: Where an appropriate time limit under 37 CFR 1.494 or 1.495 has not been met, a petition to revive (37 CFR 1.137(a) or (b)) must be filed and granted to restore the application to pending status.

PRELIMINARY AMENDMENT

Assistant Commissioner for Patents
Washington, D.C. 20231
BOX PCT

S I R:

Prior to examination of the above-identified application please amend the application as follows:

IN THE SPECIFICATION:

Page 12, line 1, delete "Claims" and insert therefor --What is claimed is:--.

IN THE CLAIMS:

Amend claim 4, 6, 7, 10-12, 14-21, 27, and 28 to read as follows:

4. A method as claimed in claim 1, wherein said predetermined condition is that the strength of the communication from at least one other cell is greater than a threshold.

6. A method as claimed in claim 4, wherein information defining said threshold is included in the communication from the current cell.

7. A method as claimed in claim 1, wherein modifying information as to how the measured strength of the communication from the neighbouring cell is to be modified is in the communication from the at least one other cell.

10. A method as claimed in claim 1, wherein the current cell is changed only if the results of the comparison are such that the modified results exceed the measured strength of the communication from the current cell for a predetermined period of time.

12. A method as claimed in claim 1, wherein a value is added to the measured strength of the communication from the current cell prior to the comparing step.

14. A method as claimed in claim 1, wherein said communication from at least one of said current cell and the at least one other cell comprises the broadcast control channel.

15. A method as claimed in claim 1, wherein said station has only one or more common channels in said current cell.

16. A method as claimed in claim 1, wherein said station has at least one dedicated channel in said current cell.

17. A method as claim in claim 1, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

18. A method as claimed in claim 1, wherein said station is a mobile terminal.

19. A method as claimed in claim 1, wherein said telecommunication system is a code division multiple access system.

20. A method as claimed in claim 1, wherein said telecommunication system is a time division multiple access system.

21. A method as claimed in claim 19, wherein said telecommunication system is a code division/time division multiple access hybrid.

27. A network element as claimed in claim 25, wherein said network element is associated with the current cell.

28. A network element as claimed in claim 25, wherein said network element is associated with said at least one other cell.

Add the following new claims:

30. A method as claimed in claim 2, wherein said predetermined condition is that the strength of the communication from at least one other cell is greater than a threshold.

31. A method as claimed in claim 3, wherein said predetermined condition is that the strength of the communication from at least one other cell is greater than a threshold.

32. A method as claimed in claim 5, wherein information defining said threshold is included in the communication from the current cell.

33. A method as claimed in claim 2, wherein modifying information as to how the measured strength of the communication from the neighbouring cell is to be modified is in the communication from the at least one other cell.

34. A method as claimed in claim 3, wherein modifying information as to how the measured strength of the communication from the neighbouring cell is to be modified is in the communication from the at least one other cell.

35. A method as claimed in claim 4, wherein modifying information as to how the measured strength of the communication from the neighbouring cell is to be modified is in the communication from the at least one other cell.

36. A method as claimed in claim 5, wherein modifying information as to how the measured strength of the communication from the neighbouring cell is to be modified is in the communication from the at least one other cell.

37. A method as claimed in claim 6, wherein modifying information as to how the measured strength of the communication from the neighbouring cell is to be modified is in the communication from the at least one other cell.

38. A method as claimed in claim 2, wherein the current cell is changed only if the results of the comparison are such that the modified results exceed the measured strength of the communication from the current cell for a predetermined period of time.

39. A method as claimed in claim 3, wherein the current cell is changed only if the results of the comparison are such that the modified results exceed the measured strength of the communication from the current cell for a predetermined period of time.

40. A method as claimed in claim 4, wherein the current cell is changed only if the results of the comparison are such that the modified results exceed the measured strength of the communication from the current cell for a predetermined period of time.

41. A method as claimed in claim 5, wherein the current cell is changed only if the results of the comparison are such that the modified results exceed the measured strength of the communication from the current cell for a predetermined period of time.

42. A method as claimed in claim 6, wherein the current cell is changed only if the results of the comparison are such that the modified results exceed the measured strength of the communication from the current cell for a predetermined period of time.

43. A method as claimed in claim 7, wherein the current cell is changed only if the results of the comparison are such that the modified results exceed the measured strength of the communication from the current cell for a predetermined period of time.

44. A method as claimed in claim 8, wherein the current cell is changed only if the results of the comparison are such that the modified results exceed the measured strength of the communication from the current cell for a predetermined period of time.

45. A method as claimed in claim 9, wherein the current cell is changed only if the results of the comparison are such that the modified results exceed the measured strength of the communication from the current cell for a predetermined period of time.

46. A method as claimed in claim 2, wherein a value is added to the measured strength of the communication from the current cell prior to the comparing step.

47. A method as claimed in claim 3, wherein a value is added to the measured strength of the communication from the current cell prior to the comparing step.

48. A method as claimed in claim 4, wherein a value is added to the measured strength of the communication from the current cell prior to the comparing step.

49. A method as claimed in claim 5, wherein a value is added to the measured strength of the communication from the current cell prior to the comparing step.

50. A method as claimed in claim 6, wherein a value is added to the measured strength of the communication from the current cell prior to the comparing step.

51. A method as claimed in claim 7, wherein a value is added to the measured strength of the communication from the current cell prior to the comparing step.

52. A method as claimed in claim 8, wherein a value is added to the measured strength of the communication from the current cell prior to the comparing step.

53. A method as claimed in claim 9, wherein a value is added to the measured strength of the communication from the current cell prior to the comparing step.

54. A method as claimed in claim 10, wherein a value is added to the measured strength of the communication from the current cell prior to the comparing step.

55. A method as claimed in claim 11, wherein a value is added to the measured strength of the communication from the current cell prior to the comparing step.

56. A method as claimed in claim 2, wherein said communication from at least one of said current cell and the at least one other cell comprises the broadcast control channel.

57. A method as claimed in claim 3, wherein said communication from at least one of said current cell and the at least one other cell comprises the broadcast control channel.

58. A method as claimed in claim 4, wherein said communication from at least one of said current cell and the at least one other cell comprises the broadcast control channel.

59. A method as claimed in claim 5, wherein said communication from at least one of said current cell and the at least one other cell comprises the broadcast control channel.

60. A method as claimed in claim 6, wherein said communication from at least one of said current cell and the at least one other cell comprises the broadcast control channel.

61. A method as claimed in claim 7, wherein said communication from at least one of said current cell and the at least one other cell comprises the broadcast control channel.

62. A method as claimed in claim 8, wherein said communication from at least one of said current cell and the at least one other cell comprises the broadcast control channel.

63. A method as claimed in claim 9, wherein said communication from at least one of said current cell and the at least one other cell comprises the broadcast control channel.

64. A method as claimed in claim 10, wherein said communication from at least one of said current cell and the at least one other cell comprises the broadcast control channel.

65. A method as claimed in claim 11, wherein said communication from at least one of said current cell and the at least one other cell comprises the broadcast control channel.

66. A method as claimed in claim 12, wherein said communication from at least one of said current cell and the at least one other cell comprises the broadcast control channel.

67. A method as claimed in claim 13, wherein said communication from at least one of said current cell and the at least one other cell comprises the broadcast control channel.

68. A method as claimed in claim 2, wherein said station has only one or more common channels in said current cell.

69. A method as claimed in claim 3, wherein said station has only one or more common channels in said current cell.

70. A method as claimed in claim 4, wherein said station has only one or more common channels in said current cell.

71. A method as claimed in claim 5, wherein said station has only one or more common channels in said current cell.

72. A method as claimed in claim 6, wherein said station has only one or more common channels in said current cell.

73. A method as claimed in claim 7, wherein said station has only one or more common channels in said current cell.

74. A method as claimed in claim 8, wherein said station has only one or more common channels in said current cell.

75. A method as claimed in claim 9, wherein said station has only one or more common channels in said current cell.

76. A method as claimed in claim 10, wherein said station has only one or more common channels in said current cell.

77. A method as claimed in claim 11, wherein said station has only one or more common channels in said current cell.

78. A method as claimed in claim 12, wherein said station has only one or more common channels in said current cell.

79. A method as claimed in claim 13, wherein said station has only one or more common channels in said current cell.

80. A method as claimed in claim 14, wherein said station has only one or more common channels in said current cell.

81. A method as claimed in claim 2, wherein said station has at least one dedicated channel in said current cell.

82. A method as claimed in claim 3, wherein said station has at least one dedicated channel in said current cell.

83. A method as claimed in claim 4, wherein said station has at least one dedicated channel in said current cell.

84. A method as claimed in claim 5, wherein said station has at least one dedicated channel in said current cell.

85. A method as claimed in claim 6, wherein said station has at least one dedicated channel in said current cell.

86. A method as claimed in claim 7, wherein said station has at least one dedicated channel in said current cell.

87. A method as claimed in claim 8, wherein said station has at least one dedicated channel in said current cell.

88. A method as claimed in claim 9, wherein said station has at least one dedicated channel in said current cell.

89. A method as claimed in claim 10, wherein said station has at least one dedicated channel in said current cell.

90. A method as claimed in claim 11, wherein said station has at least one dedicated channel in said current cell.

91. A method as claimed in claim 12, wherein said station has at least one dedicated channel in said current cell.

92. A method as claimed in claim 13, wherein said station has at least one dedicated channel in said current cell.

93. A method as claimed in claim 14, wherein said station has at least one dedicated channel in said current cell.

94. A method as claim in claim 2, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

95. A method as claim in claim 3, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

96. A method as claim in claim 4, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

97. A method as claim in claim 5, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

98. A method as claim in claim 6, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

99. A method as claim in claim 7, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

100. A method as claim in claim 8, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

101. A method as claim in claim 9, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

102. A method as claim in claim 10, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

103. A method as claim in claim 11, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

104. A method as claim in claim 12, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

105. A method as claim in claim 13, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

106. A method as claim in claim 14, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

107. A method as claim in claim 15, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

108. A method as claim in claim 16, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

109. A method as claimed in claim 2, wherein said station is a mobile terminal.

110. A method as claimed in claim 3, wherein said station is a mobile terminal.

111. A method as claimed in claim 4, wherein said station is a mobile terminal.

112. A method as claimed in claim 5, wherein said station is a mobile terminal.

113. A method as claimed in claim 6, wherein said station is a mobile terminal.

114. A method as claimed in claim 7, wherein said station is a mobile terminal.

115. A method as claimed in claim 8, wherein said station is a mobile terminal.

116. A method as claimed in claim 9, wherein said station is a mobile terminal.

117. A method as claimed in claim 10, wherein said station is a mobile terminal.

118. A method as claimed in claim 11, wherein said station is a mobile terminal.

119. A method as claimed in claim 12, wherein said station is a mobile terminal.

120. A method as claimed in claim 13, wherein said station is a mobile terminal.

121. A method as claimed in claim 14, wherein said station is a mobile terminal.

122. A method as claimed in claim 15, wherein said station is a mobile terminal.

123. A method as claimed in claim 16, wherein said station is a mobile terminal.

124. A method as claimed in claim 17, wherein said station is a mobile terminal.

125. A method as claimed in claim 2, wherein said telecommunication system is a code division multiple access system.

126. A method as claimed in claim 3, wherein said telecommunication system is a code division multiple access system.

127. A method as claimed in claim 4, wherein said telecommunication system is a code division multiple access system.

128. A method as claimed in claim 5, wherein said telecommunication system is a code division multiple access system.

129. A method as claimed in claim 6, wherein said telecommunication system is a code division multiple access system.

130. A method as claimed in claim 7, wherein said telecommunication system is a code division multiple access system.

131. A method as claimed in claim 8, wherein said telecommunication system is a code division multiple access system.

132. A method as claimed in claim 9, wherein said telecommunication system is a code division multiple access system.

133. A method as claimed in claim 10, wherein said telecommunication system is a code division multiple access system.

134. A method as claimed in claim 11, wherein said telecommunication system is a code division multiple access system.

135. A method as claimed in claim 12, wherein said telecommunication system is a code division multiple access system.

136. A method as claimed in claim 13, wherein said telecommunication system is a code division multiple access system.

137. A method as claimed in claim 14, wherein said telecommunication system is a code division multiple access system.

138. A method as claimed in claim 15, wherein said telecommunication system is a code division multiple access system.

139. A method as claimed in claim 16, wherein said telecommunication system is a code division multiple access system.

140. A method as claimed in claim 17, wherein said telecommunication system is a code division multiple access system.

141. A method as claimed in claim 18, wherein said telecommunication system is a code division multiple access system.

142. A method as claimed in claim 2, wherein said telecommunication system is a time division multiple access system.

143. A method as claimed in claim 3, wherein said telecommunication system is a time division multiple access system.

144. A method as claimed in claim 4, wherein said telecommunication system is a time division multiple access system.

145. A method as claimed in claim 5, wherein said telecommunication system is a time division multiple access system.

146. A method as claimed in claim 6, wherein said telecommunication system is a time division multiple access system.

147. A method as claimed in claim 7, wherein said telecommunication system is a time division multiple access system.

148. A method as claimed in claim 8, wherein said telecommunication system is a time division multiple access system.

149. A method as claimed in claim 9, wherein said telecommunication system is a time division multiple access system.

150. A method as claimed in claim 10, wherein said telecommunication system is a time division multiple access system.

151. A method as claimed in claim 11, wherein said telecommunication system is a time division multiple access system.

152. A method as claimed in claim 12, wherein said telecommunication system is a time division multiple access system.

153. A method as claimed in claim 13, wherein said telecommunication system is a time division multiple access system.

154. A method as claimed in claim 14, wherein said telecommunication system is a time division multiple access system.

155. A method as claimed in claim 15, wherein said telecommunication system is a time division multiple access system.

156. A method as claimed in claim 16, wherein said telecommunication system is a time division multiple access system.

157. A method as claimed in claim 17, wherein said telecommunication system is a time division multiple access system.

158. A method as claimed in claim 18, wherein said telecommunication system is a time division multiple access system.

159. A method as claimed in claim 19, wherein said telecommunication system is a time division multiple access system.

160. A method as claimed in claim 20, wherein said telecommunication system is a code division/time division multiple access hybrid.

161. A network element as claimed in claim 26, wherein said network element is associated with the current cell.

162. A network element as claimed in claim 26, wherein said network element is associated with said at least one other cell.

REMARKS

This preliminary amendment is presented to place the application in proper form for examination and to eliminate multiple dependency from the present claims. No new matter has been added. Early examination and favorable consideration of the above-identified application is earnestly solicited.

Attached hereto is a mark-up version of the changes made to the specification and claims by the current amendment. The attached page is captioned "**Version with markings to show changes made**".

Any additional fees or charges required at this time in connection with the application may be charged to our Patent and Trademark Office Deposit Account No. 03-2412.

Respectfully submitted,
COHEN, PONTANI, LIEBERMAN & PAVANE

AMENDMENTS TO THE SPECIFICATION AND CLAIMS SHOWING CHANGES

The claims have been amended as follows:

4. A method as claimed in [any preceding] claim 1, wherein said predetermined condition is that the strength of the communication from at least one other cell is greater than a threshold.

6. A method as claimed in claim 4 [or 5], wherein information defining said threshold is included in the communication from the current cell.

7. A method as claimed in [any preceding] claim 1, wherein modifying information as to how the measured strength of the communication from the neighbouring cell is to be modified is in the communication from the at least one other cell.

10. A method as claimed in [any preceding] claim 1, wherein the current cell is changed only if the results of the comparison are such that the modified results exceed the measured strength of the communication from the current cell for a predetermined period of time.

12. A method as claimed in [any preceding] claim 1, wherein a value is added to the measured strength of the communication from the current cell prior to the comparing step.

14. A method as claimed in [any preceding] claim 1, wherein said communication from at least one of said current cell and the at least one other cell comprises the broadcast control channel.

15. A method as claimed in [any one of the preceding claims] claim 1, wherein said station has only one or more common channels in said current cell.

16. A method as claimed in [any one of claim 1 to 14] claim 1, wherein said station has at least one dedicated channel in said current cell.

17. A method as claim in [any preceding] claim 1, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

18. A method as claimed in [any preceding] claim 1, wherein said station is a mobile terminal.

19. A method as claimed in [any preceding] claim 1, wherein said telecommunication system is a code division multiple access system.

20. A method as claimed in [any preceding] claim 1, wherein said telecommunication system is a time division multiple access system.

21. A method as claimed in claim 19 [and 20], wherein said telecommunication system is a code division/time division multiple access hybrid.

27. A network element as claimed in claim 25 [or 26], wherein said network element is associated with the current cell.

28. A network element as claimed in claim 25 [or 26], wherein said network element is associated with said at least one other cell.

A METHOD OF SELECTING A NEW CELL

FIELD OF THE INVENTION

The present invention relates to a method for selecting a new cell.

BACKGROUND TO THE INVENTION

In a wireless cellular telecommunications network, the area covered by the network is divided into an plurality of cells. Each cell is provided with a base station which is able to communicate with mobile stations located in the cell associated with the base station. The mobile stations are able to move from cell to cell. When a mobile station moves from one cell to another, this is referred to as handoff. In this document, the term cell will be used to refer to cells and/or cell sectors.

In current systems, the mobile station is arranged to monitor channels from a number of base stations in the cells neighbouring the cell in which the mobile station is currently located. The mobile station measures the received strength of the signals from the surrounding base stations. Based on this information a decision is made as to whether the current cell is to be changed and if so to which cell. However this method has the disadvantage of not receiving any information relating to, for example, traffic conditions in the neighbouring cells. This means that the mobile station's decision will be based solely on the magnitude of the received signals. Accordingly, the mobile station will not always make the appropriate decision.

A common channel of the neighbouring cell could be continuously monitored and decoded by a mobile station in a different cell in order to obtain information on an adjacent cell. However, this is disadvantageous if a mobile station is in an idle state as it will consume power reducing the battery life. This channel could be the broadcast control channel BCCH.

SUMMARY OF THE INVENTION

It is an aim of embodiments of the present invention to address the disadvantage with the prior art.

According to one aspect of the present invention there is provided a method for selecting a new cell for a station in a cellular telecommunications system, said station being associated with a current cell, said method comprising the steps of measuring at the station the strength of a communication from said current cell; measuring at the station the strength of a communication from at least one other cell; modifying the result of the measuring step in which the strength of the communication from at least one other cell and/or the current cell is measured to take into account a condition of said current and/or said at least one other cell if the measured strength of the communication from the current cell and/or the measured strength of the communication from the at least one other cell satisfy a predetermined condition; if the modifying step is performed, comparing the measured strength of said communication from the current cell and the measured strength of the communication from the at least one other cell, at least one of the measured strengths being modified in the modifying step; and depending of the results of the comparison, changing the current cell with which the station is associated.

According to a second aspect of the present invention there is provided a station for use in a cellular telecommunications system, said station being associated with a current cell, said station comprising means for measuring the received strength of a communication from said current cell; means for measuring the received strength of a communication from at least one other cell; means for modifying the measured received strength of the communication from the at least one other cell to take into account a condition of said current and/or said at least one other cell if the measured strength of the communication from the current cell and/or the measured strength of the communication

from the at least one other cell satisfy a predetermined condition; means for comparing if the modification means modifies the measured received strength of the communication from the at least one other cell, the modified result with the measured received strength of a communication from the current cell; and means for causing, depending of the results of the comparison performed by the comparing means, the current cell with which the station is associated to be changed.

BRIEF DESCRIPTION OF THE DRAWINGS

For a better understanding of the present invention and as to how the same may be carried into effect, reference will now be made by way of example to the accompanying drawings in which:
Figure 1 shows a schematic view of a cellular telecommunications network in which embodiments of the present invention can be implemented;
Figure 2 shows a graph of signal strength against time for the physical channels received by a mobile station;
Figure 3 shows a graph of signal strength against time for the physical channels received by a mobile station, where the signal received from a neighbouring base station has been compensated; and
Figure 4 shows a graph of signal strength against time for the physical channels where a compensation value and hysteresis have been applied.

DETAILED DESCRIPTION OF EMBODIMENTS OF THE PRESENT INVENTION

Reference will now be made to Figure 1 which shows a wireless cellular telecommunication network. The area 2 covered by the network is divided up into cells 4a-g. Each cell 4 has a base station 6 associated therewith which transmits signals to and receives signals from mobile stations 8 which are located in the cell 4 associated with the respective base station 6.

The network shown in Figure 1 is a code division multiple access

system. This means that the same frequency can be used in adjacent cells. The channels between the mobile station and the base stations are distinguished by their spreading codes with different channels using different spreading codes. In the embodiment described hereinafter, it is assumed that the frequency used in the cells is the same.

Consider cell 4a of Figure 1. This cell is surrounded by six neighbouring cells. A mobile station 10 is in the cell 4a which will be referred to as the current cell of that mobile station. The mobile station will receive on various channels from the base station and likewise will send on various channels to the base station. The number and type of channels will depend on the mode of the mobile station. For example if the mobile station is in an idle mode where the mobile station is turned on but which is not engaged in a call, the number of channels will be relatively small.

Embodiments of the present invention can be used when a mobile station is an idle mode or in a radio resource control (RRC) mode where the mobile station is in communication with the base station using common channels. Common channels are ones which are used by more than one mobile station to transmit to the base station or which are used by the base station to transmit to more than one mobile station. Embodiments of the present invention can also be used if one or more dedicated channels have been established.

The mobile station will monitor the broadcast control channel (BCCH) transmitted by the base station of the current cell. In addition to using the information contained in the channel, the mobile station will also measure the strength with which that channel is received by the mobile station. The information contained in the BCCH channel contains information which is required by the mobile station in order to establish a connection with the base station. This information may include random access parameters, system information, frame numbers and the like. The

BCCH channel may act as a pilot channel.

In embodiments of the present invention, the BCCH will include information defining a decoding range threshold. The function of the decoding range threshold will be described in more detail hereinafter.

The mobile station 10 is also arranged to measure the received strength of the BCCH channels transmitted by one or more of the neighbouring cells. These measurements may be made continuously or may only be made when it is determined that the received signal strength of the BCCH channel from the base station of the current cell is below a signal strength threshold. Information on this threshold may be transmitted to the mobile station from the base station of the current cell on the BCCH channel or any other suitable channel. Alternatively, this threshold may be determined by the mobile station based on the history of received signal strengths. This threshold may be defined as a percentage of a measured maximum value or may be an absolute value. This threshold is optional and can be omitted.

The mobile station uses a decoding range threshold to determine which of the received BCCH signals from neighbouring base stations are to be decoded. This is illustrated in Figure 2. Line A shows the strength with which the BCCH channel is received by the mobile station from the base station of the current cell against time. Line B shows the strength with which the BCCH channel transmitted by a neighbouring base station is received against time. Line C shows the decoding threshold. As can be seen this threshold is defined as being a fixed number of decibels below the strength of the signal received from the base station of the current cell. The threshold thus varies over time in the same manner as the received strength of the signal from the base station of the current cell. When the received strength of the signal received from one or more base stations in neighbouring cells exceeds the threshold, the information contained in the BCCH channel transmitted by the neighbouring cell is decoded. In

the example shown in Figure 2, after time t1, the received strength of the signal from the neighbouring cell is above the threshold and is thus decoded.

In an alternative embodiment of the present invention, the decoding relative threshold may be replaced by an absolute threshold. In a further modification to embodiments of the invention, the decoding relative threshold is not provided and all of the BCCH channel signals received from neighbouring cells are decoded.

The BCCH channel received from the neighbouring cell is decoded in order to obtain offset information. This offset information can take the form of an absolute value, a percentage value or any other form. This value may reflect the traffic conditions in the neighbouring cells. For example, if there is a large amount of traffic in the neighbouring cell, then the offset value will reflect this. The offset value may additionally or alternatively indicate if the user of the mobile station is permitted to operate in the neighbouring cell. In this latter case, the offset value may be a weighting value. The offset value may also be indicative of the strength at which the BCCH channel is transmitted by the base station in the neighbouring cell. For example, if the BCCH is transmitted with a relatively low power, then the offset value may be relatively large. On the other hand, if the signal is transmitted with a relatively high power, then the offset value may be relatively small or even negative.

The offset value can be positive, negative or zero.

The offset value is added to the received strength of the signal in the neighbouring cell. This offset value is relatively static and changes only slowly with time in preferred embodiments of the present invention. In alternative embodiments of the present invention the offset value may change relatively frequently depending on what is represented by that offset value.

In general terms, the offset value is representative of the ability of the neighbouring cell to accept the mobile station. This may reflect the traffic conditions in the neighbouring cell which may or may not take into account the traffic conditions in the current cell. Alternatively or additionally the offset value may reflect whether or not the mobile station is permitted to enter the cell or may be such as to discourage/encourage the mobile station to use the neighbouring cell.

The offset value may be alternatively or additionally be a value which is subtracted from, multiplied with or divided into the received signal strength of the signal from the neighbouring cell. In an alternative embodiment of the invention, the offset value may be replaced by an offset function which modifies the received signal strength value in accordance with that function.

In preferred embodiments of the present invention, the offset value and the decoding range are of similar or the same magnitude.

Reference is made to Figure 3 which shows a curve B of Figure 2. Curve D represents the strength of the received signal from the neighbouring cell to which the offset value has been added. The graph also shows curve A of Figure 2 which represents the strength of the received signal from the base station of the current cell. When the compensated value of the strength of the received signal exceeds that of the of the received strength of the signal from the current cell, the mobile station is allocated to the neighbouring cell and that neighbouring cell then becomes the current cell.

It should be appreciated that the received signal strength for the current cell can also be modified by an offset value. This offset value is obtained from the BCCH channel transmitted by the base station of the current cell. This may be as an alternative to the modification of the received strength of the signal from the base station in the neighbouring cell. However in preferred

embodiments of the present invention both the received strength of the signal from the neighbouring cell as well as the received strength of the signal from the current cell are modified by respective offset values.

In a preferred embodiment of the invention, a timer is used. This timer is arranged to ensure that the current cell is only changed when necessary. In particular the changing of the current cell only takes place if the modified received strengths of the signals from the neighbouring cells exceeds the received strengths of the signals from the current cell (which may or may not be modified by the offset value) for a predetermined time. As can be seen from Figure 3, the modified received strength of the signal from the neighbouring base station exceeds the received strength of the signal from the current base station at time t2. However, the current cell is not changed until time t3 which is after time t2. From time t2 to time t3 (time T), the modified received signal strength of the neighbouring cell exceeds the received signal strength of the current cell. If this occurs, then the neighbouring cell becomes the current cell.

If the modified received signal strength of neighbouring cell does not exceed the received signal strength of the current cell for a time T, then the current cell is not changed.

The time T may be a fixed time or may vary. If T varies, this could take into account the environment and/or the traffic. Information as to the value of T may be included in the BCCH channel of the current base station and/or the neighbouring base station.

Where embodiment of the invention are utilised in a system where the frequency used in the neighbouring cell is the same as in the current cell, the time T should be relatively short in order to minimise interference effects.

It should be appreciated that embodiments of the present

invention can be used in soft handoff situations. Handoff is where a mobile station moves from one cell into another and therefore changes the base station with which it is in communication. Soft handoff occurs usually, but not necessarily, where a mobile station is in the border region of two or more cells. In soft handoff, the mobile station will be in active communication with two or more base stations at the same time and will combine the information received from the different base stations. The mobile station receives the same information from more than one base station.

Embodiments of the invention can be used to make decisions as to when to go into soft handoff and when to just communicate with a single base station. For example when the strength of the signal received from the neighbouring base station exceeds that of the current base station, then the mobile station could go into soft handoff where it communicates actively with the base stations of the current and the neighbouring cells. The mobile station may just communicate with the base station of the neighbouring cell when the difference between the received signal strengths exceeds a threshold. Alternatively the offset value(s) used to compensate the received signal strengths of the neighbouring and/or current cells is altered so that the compensated received strength of the signal from the neighbouring cell is less than the received strength of the signal from the current cell. The next time that the compensated strength of the signal received from the neighbouring cells is greater than that for the current cell, the mobile station only actively communicates with the base station of the neighbouring cell which then becomes the current cell.

An offset timer may be used in the above described embodiments. This timer indicates to the mobile station how often the mobile station should update its offset value. The mobile station will not decode again the BCCH channel from the base station of the neighbouring cell until the time defined by the timer has expired. This is regardless of whether or not the signal received from the neighbouring cell is above the threshold discussed in

relation to Figure 2. When the timer has expired, the next time that the strength of the signal received from the neighbouring cells exceeds the threshold, the BCCH channel of the neighbouring base station is decoded to obtain the offset value.

The timer may be predefined or may vary with time. In the latter case, the timer may take into account the current traffic conditions and/or the radio environment. The value of the timer may be included in the BCCH channel of the current base station or the neighbouring base station.

It is preferred that the timer be relatively long so as not to decrease the standby time when the mobile station is not in use.

A further modification to the system and method described herein before will now be described with reference to Figure 4 which illustrates the use of hysteresis. Figure 4 shows curves A, B and D of Figure 3. These curves are the same as described hereinbefore and accordingly will not be described in any more detail hereinafter. Hysteresis is used to avoid excessive changes in the current cell identity. The hysteresis value may be broadcast on the BCCH channel of the current cell or that of the neighbouring cell. Alternatively the hysteresis value may be prestored in the mobile station.

The mobile station adds the hysteresis value to the received signal strength values for the current cell. This hysteresis value may be in addition or instead of an offset value which is added to the results of the received signal strength measurement for the current cell. This is represented by curve E of Figure 4. This summed value is compared to the offset adjusted received signal strength for the neighbouring cell. If the latter value exceeds the former then the mobile station will change its current cell to the neighbouring cell. The hysteresis value may be relatively small in order to minimise interference effects.

The hysteresis value may only be added to the value of the

measured signal strength for the current cell. If the current cell is no longer the current cell, then the hysteresis value will no longer be added to the measured signal strength of the old current cell. Instead the same or a different hysteresis value will be added to the measured signal strength for the new current cell.

The hysteresis value is provided in order to prevent ping-pong selections of the new and old current cells.

In embodiments of the invention described hereinbefore, the mobile station monitored the BCCH channel. It should be appreciated that in alternative embodiments of the present invention, the mobile station can monitor any other suitable channel or channels. The monitored channels in the current and neighbouring cells may be the same or different. Required information may be obtained from different channels of the same base station. Embodiments of the invention have been described in the context of the cell reselection where the mobile station is an idle or the like mode where the mobile station is in communication only via one or more common channels with the base station. However embodiments of the present invention are also applicable to handover situations. This is where the mobile station has one or more dedicated channels established with the base station of the current cell and the base station of a neighbouring cell becomes the one which is in active communication with the mobile station.

It should be appreciated, that it is possible to transmit one or more of the values described hereinbefore to the mobile station using a dedicated channel, particularly but not necessarily if that channel has already been established.

In a system embodying the present invention, only some of the mobile stations may be able to implement the present invention. Accordingly, the network may require signalling to determine if a given mobile station is capable of implementing the embodiments

of the invention. Those mobile stations which are capable of implementing embodiments of the invention will do so. However, those mobile stations which are not able to do so will use an alternative method. This may means that measurements made by the mobile station are used by a base station or other network element to make the required decisions. Alternatively, the mobile station may use a different strategy to identify new current cells.

Embodiments of the present invention have been described in the context of a system where the same frequency is used in adjacent cells. Embodiments of the present invention can be used in systems where a number of frequencies are used in each cell, with at least some of the same frequencies being used in adjacent cells. In this case, the mobile station may monitor the same frequency in the adjacent cell to that which is currently being used by the mobile station. Alternatively, the mobile station may monitor a different frequency to that of the current cell.

Embodiments of the present invention can also be used where the frequency used in adjacent cells is always different from that used in the cell where the mobile station is currently located.

In embodiments of the present invention, the same frequency can be used by the mobile station and the base station transmissions. Alternatively different frequencies can be used by the mobile station and base station transmissions. The frequency used can have a wide range or a narrow range.

Embodiments of the invention can be used where there is more than one neighbour cell and there is therefore more than one communication from the neighbouring cells which is measured and to which offset values are applied.

The mobile station may be mobile telephone, a portable computer or any other suitable device. Embodiments of the invention may be used with fixed terminals if for example the borders of a cell

change depending on the amount of traffic in the cells.

Whilst embodiments of the present invention have been described in the context of a CDMA system, it should be appreciated that embodiments of the present invention can also be used with any other suitable system such a other types of spread spectrum system, time division multiple access systems, frequency division multiple access systems and hybrids of any one or more of these systems.

CLAIMS

1. A method for selecting a new cell for a station in a cellular telecommunications system, said station being associated with a current cell, said method comprising the steps of:

measuring at the station the strength of a communication from said current cell;

measuring at the station the strength of a communication from at least one other cell;

modifying the result of the measuring step in which the strength of the communication from at least one other cell and/or the current cell is measured to take into account a condition of said current and/or said at least one other cell if the measured strength of the communication from the current cell and/or the measured strength of the communication from the at least one other cell satisfy a predetermined condition;

if the modifying step is performed, comparing the measured strength of said communication from the current cell and the measured strength of the communication from the at least one other cell, at least one of the measured strengths being modified in the modifying step; and

depending of the results of the comparison, changing the current cell with which the station is associated.

2. A method as claimed in claim 1, wherein in said modifying step, a value is added to the result of the measuring step in which the strength of a communication from the at least one other cell is measured.

3. A method as claimed in claim 1, wherein in said modifying step, a function is applied to the result of the measuring step in which the strength of a communication from the at least one other cell is measured.

4. A method as claimed in any preceding claim, wherein said predetermined condition is that the strength of the communication from at least one other cell is greater than a threshold.

5. A method as claimed in claimed in claim 4, wherein said threshold is defined relative to the strength of the communication from the current cell.

6. A method as claimed in claim 4 or 5, wherein information defining said threshold is included in the communication from the current cell.

7. A method as claimed in any preceding claim, wherein modifying information as to how the measured strength of the communication from the neighbouring cell is to be modified is in the communication from the at least one other cell.

8. A method as claimed in claim 7, wherein the station is provided with timing information defining when the station should next check for said modifying information.

9. A method as claimed in claim 8, wherein said timing information is in the communication from the neighbouring cell.

10. A method as claimed in any preceding claim, wherein the current cell is changed only if the results of the comparison are such that the modified results exceed the measured strength of the communication from the current cell for a predetermined period of time.

11. A method as claimed in claim 10, wherein information defining the predetermined period of time is in the communication from said current cell.

12. A method as claimed in any preceding claim, wherein a value is added to the measured strength of the communication from the current cell prior to the comparing step.

13. A method as claimed in claim 12, wherein if the current cell is changed, said value is no longer added to the measured strength of the communication from the old current cell and a

value is added to the measured strength of the communication from the new current cell.

14. A method as claimed in any preceding claim, wherein said communication from at least one of said current cell and the at least one other cell comprises the broadcast control channel.

15. A method as claimed in any one of the preceding claims, wherein said station has only one or more common channels in said current cell.

16. A method as claimed in any one of claims 1 to 14, wherein said station has at least one dedicated channel in said current cell.

17. A method as claimed in any preceding claim, wherein the station is arranged to use the same frequency in the current cell and the at least one other cell.

18. A method as claimed in any preceding claim, wherein said station is a mobile terminal.

19. A method as claimed in any preceding claim, wherein said telecommunication system is a code division multiple access system.

20. A method as claimed in any preceding claim, wherein said telecommunication system is a time division multiple access system.

21. A method as claimed in claim 19 and 20, wherein said telecommunication system is a code division/time division multiple access hybrid.

22. A station for use in a cellular telecommunications system, said station being associated with a current cell, said station comprising:

means for measuring the received strength of a communication from said current cell;

means for measuring the received strength of a communication from at least one other cell;

means for modifying the measured received strength of the communication from the at least one other cell to take into account a condition of said current and/or said at least one other cell if the measured strength of the communication from the current cell and/or the measured strength of the communication from the at least one other cell satisfy a predetermined condition;

means for comparing if the modification means modifies the measured received strength of the communication from the at least one other cell, the modified result with the measured received strength of a communication from the current cell; and

means for causing, depending of the results of the comparison performed by the comparing means, the current cell with which the station is associated to be changed.

23. A cellular telecommunications network comprising:

at least one station as claimed in claim 22, and at least one other station, said at least one other station requiring a different procedure in order to determine if a new current cell is required.

24. A network as claimed in claim 23, wherein the signalling sent by said network to said at least one station and to said at least one other station is dependent on the procedure required by the respective stations to determine if a new current cell is required.

25. A network element in a telecommunications system for sending communications to a station associated with a current cell network element being associated with a cell, said network element being arranged to send information to said station, said information being used by said station to modify measurements of the strength of communications from at least one other cell.

26. A network element in a telecommunications system for sending communications to a station associated with a current cell network element being associated with a cell, said network element being arranged to send information to said station, wherein said information comprises information defining a threshold, wherein said station is arranged to modify measurements of the received strength of communications from at least one other cell if the measurements exceed said threshold.

27. A network element as claimed in claim 25 or 26, wherein said network element is associated with the current cell.

28. A network element as claimed in claim 25 or 26 wherein said network element is associated with said at least one other cell.

29. A method for changing at least one current cell, in a cellular telecommunications network, with which a station is associated, said method comprising the steps of:

measuring at the station the strength of a communication from said at least one current cell;

measuring at the station the strength of a communication from at least one other cell;

modifying the result of the measuring step in which the strength of the communication from at least one other cell and/or the at least one current cell is measured to take into account a condition of said at least one current and/or said at least one other cell if the measured strength of the communication from the current cell and/or the measured strength of the communication from the at least one other cell satisfy a predetermined condition;

if the modifying step is performed, comparing the measured strength of the communication from at least one current cell and the measured strength of a communication from the at least one other cell, at least one of said measured strengths being modified in the modifying step; and

depending of the results of the comparison, changing the at least one current cell with which the station is associated.

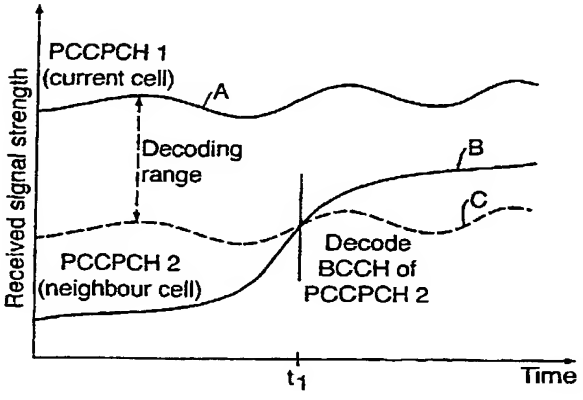
(54) Title: A METHOD OF SELECTING A NEW CELL



(57) Abstract: A method for selecting a new cell for a station in a cellular telecommunications system, the station being associated with a current cell is provided. The method comprises the steps of measuring at the station the strength of a communication from the current cell, measuring at the station the strength of a communication from at least one other cell, modifying the result of the measuring step in which the strength of the communication from at least one other cell and/or the current cell is measured to take into account a condition of the current and/or said at least one other cell if the measured strength of the communication from the current cell and/or the measured strength of the communication from the at least one other cell satisfy a predetermined condition, if the modifying step is performed, comparing the measured strength of the communication from the current cell and the measured strength of the communication from the at least one other cell at least one of the measured strengths being modified in the modifying step and depending on the results of the comparison changing the current cell with which the station is associated.
